REMBRANDT®

Chromosomal enumeration probes ISH detection assay

CEPs are commonly used in cancer diagnosis, prenatal diagnosis, and in the identification of chromosomal abnormalities associated with developmental disorders. The REMBRANDT® Chromosomal enumeration probe detection assays are able to detect and localize chromosomal abnormalities within patient samples.

CEPs can be useful in cancer diagnosis and prognosis. Chromosomal ISH probes can be used to detect aneuploidy in cancer cells, which is a common characteristic of many types of cancer. Aneuploidy can be used as a diagnostic and prognostic marker in various cancers, such as bladder cancer, ovarian cancer, and breast cancer.
